1 General information

1.1 Preface

We congratulate you to your new Range Servant machine. You have made a good choice! Not only have you chosen an excellent state-of-the-art Ball Dispenser with little demands on maintenance but you have also chosen quality. Quality is ensured with the help of modern production techniques, carefully chosen materials and the responsible workmanship of our staff.

This User’s Manual contains all the information necessary to fully understand the maintenance and operation of the machine. The machine may be equipped with another a bit more complicated control system referred to as the Select System, in which case some of the information given herein does not apply. Please then refer to the separate manual for the Select System.

Study the User’s Guide carefully before using the machine. If these instructions are not followed, persons using the machine might be injured or the equipment itself be damaged. In many cases, following the instructions is a necessary condition for Range Servants’ warranty to be applicable. Every person operating the machine must read these instructions.

No part of this publication may be reproduced without the written authorisation of Range Servant.

We now offer a limited three-year warranty on our Ball Dispensers. This does not include payment systems and normal wear and tear. Study the warranty conditions carefully and keep them in a safe place. If you have any questions, or if problems should arise, please contact your Range Servant representative.

THREE-YEARS WARRANTY

Range Servant AB hereby undertakes to provide a warranty on material and function on the RANGE SERVANT dispenser for three years from the date of delivery. The guarantee does not cover payment systems and wearing parts. This engagement applies to repaired or replaced components for a period of three months. This undertaking only applies to the original purchaser. It also applies only to shortcomings of those parts, which the manufacturer verifies after due inspection. Repairs or replacement of parts may only be carried out by a representative authorised by the manufacturer. The manufacturer also guarantees that the equipment delivered matches the product description supplied. THE UNDERTAKINGS SPECIFIED IN THIS AGREEMENT CONSTITUTE THE MANUFACTURER’S SOLE OBLIGATION TOWARDS THE PURCHASER. THE MANUFACTURER IS IN NO WAY RESPONSIBLE FOR ANY UNDERTAKINGS OUTSIDE THE FRAMEWORK OF THIS WARRANTY CERTIFICATE. Neither is the manufacturer responsible for any undertakings given by any outside person during the sales negotiations. The warranty agreement does not apply to equipment that has been repaired or replaced by persons/companies not authorised by the manufacturer. The manufacturer’s warranty undertaking does not apply if the equipment is used incorrectly, if it has been damaged through improper maintenance or accidents or if it has been handled in a way not specified in the manual which is supplied with the dispenser upon delivery. The manufacturer is also free from financial liability for any type of injury that may arise in connection with the sale and repair of the equipment and from injuries to third parties in conjunction with its use.
1.2 EC Declaration of Conformity

In accordance with the Machine Directive 89/392/EEC, annex IIA.

1.3 Description

1.3.1 Ball Dispenser
The Ball Dispenser can be used either as a stand-alone machine or it can be integrated into a complete, automated system - the Range Servant Ball Management System.

The user-friendly ball dispensers from Range Servant are designed to accept different types of payment and to deliver, quickly and consistently, the exact number of balls. Prices are differentiated and several payment methods can be used in parallel. The number of dispensed balls per payment can be easily changed by the user himself. The balls are handled with care and only undamaged and clean balls are delivered to the player.

1.3.2 Ball Management System
Range Servant can deliver a complete, flexible Ball Management System adaptable to any kind of driving range requirements. The Ball Dispenser can be combined with the work-efficient, environment friendly Ball Washer. The Ball Washer in turn can be connected to the Elevator, the Conveyor Belt or the Blower for the transport of clean, undamaged balls from Washer to Dispenser. The system also includes a Ball Picker machine picking up used balls from all over the driving range. Thus the circle is closed and manual work reduced to a minimum.
By applying our extensive know-how to the specific problems of every driving range we are able to offer tailor-made solutions.

1.4 Identification
When contacting Range Servant, please identify your machine with the help of the information contained in the identification plate. The identification plate is well visible and firmly attached and contains the following information:
• Name and address of the manufacturer
• CE-marking
• Designation of series or type of machine
• Serial no., if any
• Year of manufacture

Fig. 1: Product identification plate

2 Safety

2.1 General
Safety measures are a combination of measures taken by the manufacturer when designing and building the machine and measures that have to be taken by the user. The machine has been designed to function for its intended purpose. It has been designed and manufactured in such a way that configuration and maintenance can take place with the least possible risks to the operator, provided such work is carried out according to the instructions laid down in the User’s Manual. The objective of the safety measures is to eliminate all accident hazards during the operational life of the machine which also includes the assembly and dismantling of the machine, including any hazards arising as a consequence of such abnormal circumstances as can be anticipated.

Accessories and spare parts that have not been approved by Range Servant can lead to personal injuries and/or equipment damage and affect the operational reliability of the machine. For the sake of safety you should therefore exclusively use accessories and original Range Servant spare parts recommended by Range Servant. Such accessories and spare parts are specially intended for the machine and are approved by us with regard to safety.

All Range Servant retailers keep accessories and spare parts at your disposal along with competent advice. They also have the technical qualifications necessary for installing your machine and are informed about what technical changes are authorised.

Damage caused by the use of accessories and spare parts not having been approved by Range Servant and damage due to unauthorised technical modifications are not covered by the warranty obligation.

2.2 Conformity with mandatory requirements

The electrical equipment fulfil the safety provisions laid down in the EU low voltage directive 73/23/EEC, as amended by directive 93/68/EEC.

2.3 Remaining risks
There are warning signs serving as a reminder and warning to the user of any remaining risks, i.e. risks that we have not been able to eliminate, or sufficiently minimise, in our design and against which technical safety measures do not provide complete, or sufficient, protection. The warning signs shall be written in the local language and, on request, in the language understood by the respective operator. The signs are yellow with black characters. They are big enough to be readable from a distance of three meters.
• Always disconnect the power supply to the machine before carrying out maintenance or service work. The mains switch is located in the control box in the lower right hand corner of the printed circuit board.

Fig. 4: Warning signs in control box

• Never touch the circuit board or other electrical components in the control box. They can be current conducting and cause injury to person and/or equipment damage

• Mechanical or electrical alterations may only be undertaken in consultation with Range Servant.

2.4 Authorised use
The ball-dispensing machine may only be used for the distribution of golf balls. For the machine to operate properly, the balls must be clean and undamaged or else they may get stuck and cause machine failure. Distribution of balls may only start provided the machine has been installed according to the instructions contained in this Manual.

2.5 Unauthorised use
Using accessories or spare parts not recommended by Range Servant might cause personal injury and/or equipment damage and affect the operational reliability of your ball dispenser. For safety reasons, use only those components recommended by us. They are intended for your machine, they have been chosen for safety reasons and they are approved by the manufacturer. Damage caused by the use of accessories and spare parts not having been approved by Range Servant or damage due to unauthorised technical changes are not covered by the warranty obligation.
2.6 Emergencies

2.6.1 Fire
Water shall be used as an extinguisher in the event of fire, except if the fire is located in the electric equipment, where a carbon dioxide extinguisher must be used.

2.7 Operational reliability
For trouble-free operation and long service life the instructions below should be followed:

• Place the ball-dispensing machine on a firm and level surface.

• Place the machine under cover so that only the front is accessible to members of the public. If the machine is card-operated it must stand under cover for the warranty to apply.

• Never strain the machine by loading it with more balls than recommended. The loading capacity for your machine is stated in the Technical Specifications at the end of the Manual.

• The machine should be connected to its own wall socket to prevent interference with its electronic system.

• Make sure that the electric box is always properly shut and covered when rinsing the machine. Moisture and water can damage the electrical components.

• When cleaning inside the dispenser never spray water directly onto the electric motor.
3 How to use the Ball Dispenser

3.1 Necessary qualifications

Due to the complex design and operation of the machine the person carrying out service and maintenance work must have the necessary qualifications. He is required to have attended a training course, in the form of a comprehensive study of the User’s Manual, followed by a written statement to the fact that he has well understood its contents.

If the person has to be absent from work for more than three months, training has to be repeated.

3.2 BA-99 Control System

![BA-99 Control System Diagram]

Fig. 5: BA-99 Control System

3.2.1 Introduction

The BA-99 system has three payment channels marked P1-P3 allowing the user to choose between three different amounts of balls to be dispensed ranging from 1-999. The desired amount is selected with the help of the nine knobs located to the left of the terminal block G – P1-P3. More details are given in the following chapter “Getting started”.

Payments can also be made during the dispensing process and will then be accumulated. A green LED marked ON is lit to indicate that power is on and a red LED marked DEP to indicate that payment has been registered and that the machine is
prepared to dispense balls. The system is also equipped with a small circuit card consisting of two LED’s, a green and a red one, giving continuous information to the user. Green LED indicates that mains supply is on and red that payment has been made and that machine is in the process of dispensing.

3.2.2 Getting started
You can decide yourself how many balls you wish the machine to dispense per payment. The Ball dispenser accepts different payment methods and you are free to decide whether the machine shall make the same number of turns for all the different payments methods or not.

Connect the Ball Dispenser to the 230 VAC mains supply. Adjust the ball dispensing knobs for the respective payment channel according to wish. Make your payment and check that the correct number of balls are dispensed. The machine dispenses balls at two different speeds – low and high. Dispensing starts at low speed, which allows for the conveyor belt to start running, and then continues at high speed. When there are only five balls left, the speed is again reduced to allow for the conveyor motor to stop at the right point preventing too many balls to be delivered. If you wish to adjust the speed of the conveyor belt, see the following chapter “Adjustment of conveyor belt speed”.

Example:

**Payment channel 1**
23 Balls  
$\times 100 = 0$
$\times 10 = 2$
$\times 1 = 3$

**Payment channel 2**
54 Balls  
$\times 100 = 0$
$\times 10 = 5$
$\times 1 = 4$

**Payment channel 3**
128 Balls  
$\times 100 = 1$
$\times 10 = 2$
$\times 1 = 8$

3.2.3 Adjustment of conveyor belt speed
The control card BA-99 is equipped with two knobs for adjustment marked HI and LOW as well as with two micro-switches that are located on the upper left side of the card. Press the micro-switch corresponding to either adjustment knob HI or LOW; the conveyor belt starts moving. Use a small screw driver to adjust the speed. LOW regulates the starting speed and the dispensing speed for the last five balls. HI regulates the normal dispensing speed. The LED marked STB on the photocell located above the conveyor belt shall be burning with steady light and the LED marked OP.L shall blink with each detected ball.
3.2.4 Adjustment of photocell

The photocell is the component detecting the balls and signalling to the control system that the correct number of balls have been dispensed. The photocell sends a red signal indicating where the balls are detected.

The photocell is adjusted as follows:

- Place a ball on the highest point of the conveyor belt. Make sure it is in line with the photocell and that the red ray of light from the photocell hits the ball at a point about 2/3 of the height of the ball.
- Move the ball sideways, all the while checking that the two LED’s – STB and OP.L - of the photocell burn with steady light.
- Start dispensing and check that OP.L blinks with each detected ball.

STB = Stability LED means that the reflecting light is sufficient for detection.
OB.L = Operating LED means detection of an object.
3.3 Payment Methods and Prices

The Ball Dispenser is equipped with an operating panel where the customer can select the desired payment method. The panel contains two LED’s, openings for coins or tokens, and a slot for magnetic cards or bill scanner.

3.3.1 Range Servant® Tokens

Range Servant® has 16 different types of tokens for use in the Range Servant® mechanical token acceptor.

**Token types:** RS-I to RS-IX, RS-A to RS-H

There are also two types of tokens for use in electronic coin acceptors.

**Token types:** RS-90, RS-91
3.3.2 Mechanical Coin Control

Mechanical Coin control for one or two coins.
When a two coin control has been installed, this also includes a so called adding circuit card.
This card allows for prices that are higher than the coin value.

The adding circuit card (no. 107810) contains two 8-position DIP-switches marked DIP 1 and DIP 2 and two cable contacts.

The internal relation between the coins is set with the help of the DIP1 (switches 1-4).

The coin with the lowest value is always given value 1.
The next setting determines how many times coin 2 is bigger than coin 1.

1-2 relation           (switch 2 ON)
1-5 relation           (switch 1+3 ON)
1-10 relation         (switch 2+4 ON)

Relay output port (1 sec. impulse output) DIP 1 switch 7+ 8 ON.
The price is set and modified by changing the position of the switches on DIP 2. The value is binary which means that:

Switch | Represents
-------|------------------
1       | 1 x the smallest coin
2       | 2 x the smallest coin
3       | 4 x the smallest coin
4       | 8 x the smallest coin
5       | 16 x the smallest coin
6       | 32 x the smallest coin
7       | 64 x the smallest coin
8       | 128 x the smallest coin

The switches can be variously combined to obtain prices ranging from the biggest to the smallest coin.

Example 1: The smallest coin is 5 SEK and the biggest 10 SEK.
You wish to obtain a price of 25 SEK.
Set switch 1 (=5 SEK) and 3 (=20 SEK) in the ON position.

\[ 5 + 0 + 20 + 0 = 25 \]

Example 2: The smallest coin is 5 SEK and the biggest 10 SEK.
You wish to obtain a price of 10 SEK.
Set switch 2 (=10 SEK) in the ON position.

\[ 0 + 10 + 0 + 0 = 10 \]
3.3.3 Electronic Coin Control Cashflow 340

The electronic coin control can be programmed for up to twelve different types of coins or ten coins plus the two electronic tokens RS-90 and RS-91.

(In use from 970801 Mars® model Cashflow 340)

3.3.3.1 Change of prices, blocking of coins etc... Cashflow 340.

The following instructions describe how to modify prices, block coins etc.

1. Cut the power supply to the coin control.
2. Dismount the coin control from its holder and remove the interface protection by pulling it downwards. Re-mount the coin control in its holder.
3. Switch on the power supply to the coin control.
4. Adjust the position of the switches according to the respective function. If the switches are already in the correct position, then do the following:
   • Change the position of one switch.
   • Switch off the power supply and switch it on again.
   • Re-set the switch in the correct position and press the coin return button.
5. Carry out the desired function.
6. Again cut the power supply to the coin control and re-mount the interface protection.
7. Switch on the power supply.

Blocking a coin
1. Position the switches 1-4 as shown in the diagram.
2. Press the coin return button once.
3. Insert the coin you wish to block and check that it is blocked.
4. Press the coin return button once.
5. Check that the setting has been carried out.

Allowing a coin
6. Position the switches 1-4 as shown in the diagram.
7. Press the coin return button once.
8. Insert the coin you wish to allow and check that it is accepted.
9. Press the coin return button once.
10. Check that the setting has been carried out.

Changing the price
1. Position the switches 1-4 as shown in the diagram.
2. Press the coin return button once.
3. Insert the coin you wish the price to be and check that it is accepted.
4. Press the coin return button once.
5. Check that the setting has been carried out.

Test the coin output port
1. Position the switches as shown in the diagram.
2. Press the coin return button.
3. Check that the machine starts dispensing.
3.3.4 Manual magnetic card reader (EMC-30)

This is done by sliding a magnetic card through a card reader. The cards can be programmed to dispense anything between 1 and 30 baskets.

The card reader is equipped with a two digit display showing the number of dispenses left on the card.

You will find the wiring diagram for Magnetic card reader EMC-30 in paragraph 6.3.2.5 “Magnetic car reader EMC-30”.

Slide the card downwards through the scanner with the dark magnetic strip held away from you and facing left. The figure which appears in the display shows the number of baskets (including this one!) that you can fill from the machine.

If you only want to know how many baskets you have left, press in the knob on the left of the scanner while sliding the card through. This does not reduce the number of baskets left, as no balls will be dispensed.

Keep the card safe. Do not bend it, and keep it away from strong magnetic fields.
4 Design and function

4.1 General

The machine is intended for use as a golf ball dispenser. It consists of a ball magazine and is inside fitted with two plates on two levels for load reduction and, at the bottom, a grid.

The grid consists of a number of ball ducts, arranged next to each other and ending above a conveyor belt transporting the balls to the ball chute.

A photocell is installed in connection with the conveyor belt counting the balls being transported by the belt.

All interior surfaces are inclined so that the balls are continuously flushed downwards. The lower level allows for damaged balls and debris to be sorted out.

All essential parts of the Ball Dispenser are manufactured of stainless steel, rust protected steel or aluminium.

The Range Servant Boll Dispenser has been designed in order to provide driving range owners with a long-lasting, reliable, practical and economic golf ball management system.

4.2 Description of components

4.2.1 Grid
The lowest level inside the ball dispenser consists of a grid. On top of the grid is a movable plate. At one end of the movable plate is a funnel-shaped ball duct discharging onto a conveyor belt divided into compartments. The conveyor belt runs between a lower and upper pulley. The angle of the conveyor belt is designed so that the balls automatically roll on from one compartment to the other until all compartments are filled with balls. An electric conveyor motor runs the upper pulley and thus the conveyor belt. The conveyor motor is connected to an electronic control circuit including a photocell located next to the conveyor belt counting the balls passing on the belt.

4.2.2 Payment Methods
The ball dispenser can be operated with tokens, coins or magnetic cards. Each machine can run more than one payment system at the same time, for example combining token/coin or token/coin/card. The number of balls dispensed need not necessarily be the same for the different forms of payment (see the examples, chapter 3.3.2).

Below you can read how to alter the price on the coin mechanism, both for manual operation and the electronic system.

The price per unit when using a card mechanism is determined by the price of the card and your choice of the number of balls dispensed per card. The cards can be programmed to dispense anything between 1 and 30 baskets. You can programme the card yourself using the magnetic card programmer OBL-E, see fig. 13. or you can ask Range Servant to do it for you.
5 Maintenance

5.1 General
Range Servant will provide accessories and original spare parts together with competent advice.

Maintenance carried out correctly minimises defects and ensures maximum service life and reliable operation. Any malfunctions are detected at an early stage and are therefore easily corrected. Regular maintenance minimises defects and equipment breakdown. The following maintenance instructions only refer to the most common problems and their causes.

5.2 Periodical maintenance

5.3 Maintenance intervals and instructions
Maintenance intervals:
1. After 300 operating hours
2. Once every month
3. Once every golf season

5.4 Troubleshooting and repair

Although the operation of the machine is most reliable, problems may arise for various reasons.

Attention!

To reduce the time spent on troubleshooting, always start by checking that cables and connections are clean and tightened.

<td>There are no dispenses left on the card. Try a new card.</td>
</tr>
</tbody>
</table>

Figure 15 Troubleshooting for payment methods.

5.5 Function test

After maintenance or repair work the operation of the machine should be tested by running the machine with the front hatch open. Insert a coin/token or payment card and check that everything works to satisfaction.
6 Installation

6.1 Factory testing and configuration

The ball dispensers are always tested and configured before delivery to the customer. On this occasion all the parameters of the control system are adjusted according the customer’s wishes.

Our objective when carrying out this final check is to verify that the product corresponds on all accounts to the requirements laid down by the customer when ordering and to prevent defective products from being brought onto the market.

6.2 Installation of the ball dispenser

For trouble free operation, place the ball dispenser on a firm and level surface.

We recommend that the machine be located under cover and that only the front of the machine be accessible to members of the public. If the machine is card-operated, it must stand under cover according to the terms of the warranty.

Remove the keys tied into the opening for the ball shute in the front hatch.

The keys are identical and are used for opening the control box (see arrow).

Fig. 16: Location of keys on delivery
Inside the control box there are another four keys, all identical, which fit the lid of the ball dispenser and the front inspection hatch.

Open the lid of the ball dispenser and remove the package containing a plastic tray, a ball chute, the number of tokens ordered for the machine and other accessories, if any.

Place the plastic tray inside the control box so that the tokens fall directly into the tray. If the machine is both coin and token operated, there will be two trays for sorting both forms of payment at source.

Screw the ball chute into place over the hole in the front hatch.
The electric cable is located in the bottom of the machine and is pulled out through the hole situated on the side or in the bottom of the machine.

IMPORTANT! Do not connect the cable until the machine is ready for operation.

Fig. 20: Location of the electric cables
6.3 Installation – Wiring Diagram

To ensure safe and reliable operation, the control system must be correctly installed and grounded (earthed) and provided with good immunity against electronic noise.

6.3.1 Wiring Diagram for the connection of BA-99 to the Ball Dispenser

C: Supply voltage photocell 12VDC (BLUE)
IN: Signal from photocell (BLACK)
+: Supply voltage photocell 12VDC (BROWN)

DL: Vibrator motor 230 VAC (BROWN)
DN: Vibrator motor 230 VAC (BLUE)
L: Supply voltage 230VAC (BROWN)
N: Supply voltage 230VAC (BLUE)

Legend: LED's
RESET: Zeroing of microprocessor

6.3.2 Wiring of Payment Systems

6.3.2.1 Token Control

The token control micro switch is to be installed in the **NO** position - **Normally Open**.

*Figure 22: Wiring of Range Servant Token Control.*
6.3.2.2 Mechanical Coin Control

The mechanical coin control is wired according to the same wiring diagram as the token control (see above “Token”)

![Wiring diagram of one coin mechanical coin control](image1)

Figure 23 Wiring of the one coin mechanical coin control

6.3.2.3 Mechanical Coin Control with “adding” printed circuit card

![Wiring diagram of 2-coin+adding printed circuit card](image2)

Figure 24 Wiring of 2-coin+adding printed circuit card.
6.3.2.4 Electronic Coin Control (Mars® Cashflow 340)

The electronic coin monitor Cashflow 340 is a totaliser, programmed to send a signal causing the ball dispenser control system to start dispensing when the internal pre-set price has been reached. Twelve different types of coins/tokens can be programmed.
6.3.2.5 Magnetic Card Reader EMC-30

The Card Reader uses pre-programmed magnetic cards that can be programmed for up to 30 purchases. The magnetic cards will be programmed by Range Servant.

Figure 26: Wiring of the card reader EMC-30.
6.3.2.5 **Counter**

Counts the number of balls that are dispensed

Counts the total amount of dispenses

6.3.3.2 **Power supply**

All machines can be supplied with 230/115 VAC +/- 10% 50-60Hz.
7 Spare parts

In this chapter you will find detailed drawings of the ball dispenser showing the location of the different spare parts. The tables accompanying the drawings contain information about spare parts number and designation and the quantity of each spare part installed per machine model.

( ) = Optional accessories are marked with a parenthesis around the digit representing quantity.
- = The alternative marked with "-" depends on the customer’s choice of equipment.
